

Jollibee — Test Plan & Readout

 **Project:** Jollibee App Redesign · **Course:** UCLA Extension UX III · **Status:** 
Readout complete · **Next:** Definition phase · **Team:** #3 — *Danny Kim, Mike Laugherty, Kate Yudina* · **Created:** 2026-07-07 · **Updated:** 2026-07-12 · **Jump to:**
[Results & Findings ↓](#)

Summary

This page is the test plan and readout for our survey and think-aloud walkthrough, part of our design challenge to improve Jollibee's order-ahead app experience for value-conscious families across generations. We set out to confirm whether the pains and gains from our value proposition canvas and journey map show up for real users, and which proposed solutions people would actually value. The study is complete: 21 survey responses plus 2 app walkthroughs (1 think-aloud interview, 1 team self-walkthrough) confirmed personalization (H1) and customization confusion (H2) as our strongest pains, partly confirmed accessibility (H3) and payments (H4), and ruled out the cart icon as the problem we assumed. Two solutions are moving to prototyping: personalization shortcuts on the home screen and accessibility fixes on the menu and cart screens. [Full results in Results & Findings below.](#)

Timeline

1. Preparation (plan created)	Thursday, July 9
2. Live (date study goes live)	Friday, July 10
3. Readout (data analysis, findings report)	Sunday, July 12

Objectives

Goal

Confirm which pains and gains from our value proposition canvas and journey map are real for actual users, and identify which proposed solutions people would actually value.

Success Criteria

At least 10 completed responses from people who order fast food through mobile apps

("Never" and under-18 responses are excluded at analysis). Distribution through personal networks (friends and family) plus online communities where possible. Enough evidence to identify at least 2 proposed solutions to prioritize for prototyping, and to rule out at least 1 assumption that didn't hold up with real users.

Hypotheses

Drawn from the highest-severity pains and essential gains on our value proposition canvas and journey map — these are what the survey is built to test.

H1: Personalization/favorites hypothesis

We believe a favorites shortcut on the home screen and remembered past orders will speed up meal selection for repeat customers.

H2: Customization friction

We believe that the "swap" label and inconsistent availability of swaps across menu items confuses users about what is actually being changed (product vs. modification like spice level).

H3: Accessibility issue

We believe that increasing text size and touch-target size on the checkout screen will reduce input errors and checkout abandonment, especially for users with visual or motor accessibility needs.

H4: Payment method flexibility

We believe the app's payment limitations create checkout friction: only one card can be saved (it can be edited, but a second card can't be added), and options like PayPal, Venmo, EBT SNAP, and Cash App aren't supported — a real constraint for value-conscious families who split spending across cards and benefits.

Participants

Psychographic	Value-conscious, deal-seeking; drawn to affordable, tasty comfort food and gathering together (per our value proposition canvas). Range of tech comfort represented, from less tech-fluent to power users.
Region	No restriction — the Jollibee-specific questions use screenshots, so respondents don't need access to a Jollibee location.
Age	18+, spanning generations — our canvas targets families across generations, not one age group.
Gender	All
Product Familiarity	Anyone who has used a food ordering app qualifies — the Jollibee-specific questions are screenshot-based, so having the app isn't required. Jollibee app experience is captured as a profiling question and used to split regulars vs. first-timers in analysis.

Methodology

Survey

Online survey open to anyone who orders fast food through mobile apps — no Jollibee experience required. Part A asks generic behavior questions about whatever food app the respondent uses; Part B shows Jollibee app screenshots and asks first-impression questions, so respondents don't need the app installed. A profiling question splits Jollibee app regulars from first-timers for analysis. Mostly closed questions with one optional open question to catch pains we haven't mapped.

 **Live form:** <https://forms.gle/N8qGCnNR99ihnRBPA>

1:1 Think-Aloud Interviews

Each team member runs one session with a relative or friend (up to 3 total). The participant orders through the Jollibee app while thinking out loud; the moderator observes without helping or leading, prompting only with neutral nudges ("what are you thinking?"). Watch how they react to "Swap" and whether they find the cart icon on their own — don't point these out. One scripted task: "remove the soda from your order," counting the taps it takes (mis-taps can only be seen live). At the end of the session

(never during) show the Swap control and cart icon and ask what each does; these match the survey's screenshot questions so the answers can be compared. Everyone documents findings in the same format: what the participant did, where they hesitated, and notable quotes.

 **How it actually went:** We completed 1 of the 3 planned interview sessions. One team member ran their walkthrough successfully. The second member's session couldn't happen — the app showed errors that day and wouldn't work, which is its own data point about reliability. They came back another day and placed an order themselves, noting how the app works — not an interview, but a useful self-walkthrough. The third member's closest Jollibee is about 100 miles away, so an in-person pickup walkthrough wasn't possible for them. So our observations come from 1 interview session plus 1 team self-walkthrough.

Questions

Screeners — the form has no branching; disqualifying answers ("Never" / "Under 18") are filtered out at analysis

Q#	Question	Possible Answer(s)/Format	To Determine
1	How often do you order food from fast-food restaurants for pickup or delivery?	Single answer: Weekly or more / A few times a month / Once a month / Rarely / Never	Qualifies respondents: "Never" is excluded at analysis. Also splits heavy vs. occasional orderers.
2	What is your age?	Under 18 → <i>excluded at analysis</i> / 18–34 / 35–54 / 55+	Excludes minors; supports cross-generation comparison per our canvas

Main survey questions — Q1–3 and Q10–12 are about any food app; Q5–9 use Jollibee screenshots to capture first impressions; Q4 tells us who's a regular and who's a first-timer

Q#	Question	Possible Answer(s)/Format	To Determine
1	Which part of ordering food in an app	Single answer: Finding what I want to order / Customizing my meal	Shows where the pain is: "finding" points to H1, "customizing" to H2, "checkout"

	takes the most effort for you?	(options, swaps, sizes) / Checking out and paying / None of it — the whole thing is easy / Other	to H3. “None” lets people tell us everything is fine.
2	When using a food app, how often do you order the same meal or a previous order?	Always / Often / Sometimes / Rarely / Never	H1: How often users reorder the same meal — a sign of real demand for favorites/reorder shortcuts
3	When ordering food in an app, which would save you the most time?	A favorites button on the home screen / A “reorder last meal” button / Suggestions based on my past orders / None — browsing the menu is fine	H1: Which personalization feature users actually prefer, and whether demand exists at all
4	Have you ever ordered from Jollibee?	Single answer: Yes, using the Jollibee app / Yes, but only in-store or through delivery apps (UberEats, DoorDash, etc.) / No	Not a screen-out — tells us who is a Jollibee app regular and who isn’t. Regulars’ answers to the screenshot questions show whether confusion sticks around even with experience; everyone else’s show first impressions.
5	[Screenshot: Chickenjoy customization] You see this “Swap” option. What do you expect tapping it does?	Single answer: Replaces the Chickenjoy with a different item / Changes something about the Chickenjoy (e.g., spice level) / Swaps the side that comes with the meal (fries → rice) / Upgrades it — extra piece, bigger portion / Not sure	H2 (works together with Q6): Correct answer: “Changes something about the Chickenjoy” — on Chickenjoy, Swap changes the spice level. Every wrong option is how Swap really works in some other app, so wrong answers show what people expected instead.
6	[Screenshot: drink in a meal] You see “Swap” next	Single answer: Changes the size of the drink / Trades the drink for a different side instead /	H2 (works together with Q5): Correct answer: “Replaces the drink with a different drink.” Together, Q5 and Q6 test the

	to the drink. What do you expect tapping it does?	Replaces the drink with a different drink / Removes the drink and lowers the meal price / Not sure	inconsistency itself: Swap replaces the item on drinks but changes it on Chickenjoy — so nobody can get both right using one simple rule. That's exactly the confusion H2 predicts.
7	[Screenshot: home screen] What does this button in the lower right corner (the bucket with the red "1") do?	Single answer: Opens Jollibee Rewards — you have 1 reward to claim / Tracks your order — 1 order in progress / Opens your cart — you have 1 item in your order / Opens chat — you have 1 message from customer support / Not sure	H2: Correct answer: "Opens your cart." Tests the non-standard cart icon from our journey map. If answers spread across several options, that's the finding: the most important button in the app doesn't clearly say what it is.
8	[Screenshot: top bar] At the top of the screen, next to the pickup location, there's a small arrow (^). What do you think tapping it does?	Single answer: Lets you change to a different Jollibee location / Expands to show the full address, which is cut off / Shows your recent or saved Jollibee locations / Shows this store's hours and whether it's open now / Not sure	H2: Correct answer: "Expands to show the full address" (we checked in the app). Most people will likely pick "change location," because that's what this arrow does in most other apps — if they do, it shows the app breaks a habit users already have.
9	[Screenshot: My Cart screen] Take a look at this order screen. How easy would it be for you to read and use?	Single answer: Everything looks comfortable to read and tap / The text is fine, but some buttons look too small to tap accurately / Some text is too small to read, but the buttons are fine / Both the text and some buttons look too small / Not sure	H3: Separates the two parts of the hypothesis — text that's hard to read vs. buttons that are hard to tap — so we know which fix matters more. This measures how the screen looks; actual mis-taps are counted in the interview task.
10	Have you ever needed to use	Single answer: Yes, I regularly switch between	H4: Asks about real behavior without hinting at the app's limit.

	different cards to pay for food orders?	cards / Yes, occasionally / No — I always use the same card / I don't usually pay by card	Every "yes" is a person the one-saved-card restriction would actually affect — we combine this with what we found in the app (only one card can be saved).
11	Which payment methods do you expect a food ordering app to have? (Select all that apply)	Multi-select: Apple Pay / Google Pay / PayPal / Venmo / Cash App / EBT SNAP / Buy now, Pay later (e.g. Klarna) / Other	H4: Shows what people expect by default. Anything most people expect that Jollibee doesn't offer is a confirmed gap. High Apple/Google Pay picks confirm the app already covers those (added in Sept 2025).
12	If you could improve one thing about the food ordering apps you use, what would it be?	(short answer) — optional, the only non-required question	Catches pains we haven't mapped yet — public reviews suggest things like rewards, order status, and the store finder may bother people even more than our four hypotheses

Results & Findings

✅ **Method:** Google Forms survey · **Fielded:** July 10–12, 2026 · **Responses:** 21, all passed screening · **Plus:** 2 app walkthroughs (1 think-aloud interview, 1 team self-walkthrough)

Executive summary

- **Success criteria:** ✅ Met — we needed at least 10 completed responses from people who order fast food through mobile apps; we got 21, and nobody hit the exclusion filters ("Never" / under 18).
- **2 solutions we're prioritizing for prototyping:**
 1. **Personalization shortcuts on the home screen (H1)** — suggestions based on

past orders, reorder, and favorites. Finding food was the #1 pain (52.4%), two-thirds of people reorder often, and 90.5% wanted some kind of shortcut, with suggestions ranked highest (42.9%).

2. **Accessibility fixes on the menu and cart screens (H3)** — bigger text, bigger tap targets, larger menu images. Over half the survey flagged something too small, and the walkthrough backed it up: 3 taps to hit the trash can, menu images too small to scan.
- **1 assumption that didn't hold up:** the cart button. We expected the bucket icon to confuse people — it's non-standard and was flagged in our journey map — but 66.7% read it correctly on first sight. It's not perfect (a third still misread it or weren't sure), but it's not the problem we assumed it was, so it's out of prototype scope.

Survey findings

 **Where the hypotheses landed:** H1 supported (Charts 3–5) · H2 supported (Charts 6–10) · H3 partly supported (Chart 11 + walkthrough) · H4 partly supported (Charts 12–13). Details in each chart below.

Part 1: Screeners

Chart 1 — How often do you order fast food for pickup or delivery?

How often do you order food from fast-food restaurants for pickup or delivery?

 [Copy chart](#)

21 responses

47.6% order a few times a month, 19% weekly or more, 9.5% once a month, 23.8% rarely. Nobody picked "Never."

Chart 2 — Age

What is your age?

21 responses

 [Copy chart](#)

66.7% are 35–54, 28.6% are 18–34, one respondent is 55+. Nobody is under 18.

Screening result: Our plan excluded “Never” and under-18 responses at analysis. Nobody hit either filter, so all 21 responses count — well past our minimum of 10.

What this tells us about the sample: Everyone orders fast food at least sometimes, and about three-quarters order at least monthly, so answers come from real recent app experience rather than guessing. The sample leans 35–54, which matters for H3: most of our readability/tap-target answers come from mid-age adults, not seniors — so if anything, the accessibility problems we found are probably understated for older users. We wanted a cross-generation spread per our canvas; we got two generations well represented but almost no 55+, which is a limitation we’re noting.

Part 2: Main survey questions

Eleven questions plus one open-ended, testing all four hypotheses. Charts 3–5 cover finding and reordering food in any app (H1), Chart 6 profiles Jollibee experience, Charts 7–10 test first impressions of Jollibee’s screens (H2), Chart 11 checks readability and tap targets (H3), and Charts 12–13 cover payments (H4). Each chart shows the responses and a verdict: supports, partly supports, or doesn’t support.

Chart 3 — biggest effort when ordering

Which part of ordering food in an app takes the most effort for you?

[Copy chart](#)

21 responses

52.4% — finding what to order. 23.8% — customizing. 19% — none of it, it's easy. Nobody picked checkout. One write-in: finding discounts and coupons.

How it fits our hypotheses: Supports H1: finding food is the biggest pain, which is what our favorites/reorder idea targets. Partly supports H2: customization is second at 23.8%. Doesn't support H3: nobody picked checkout, though Chart 11 tests it directly.

Chart 4 — how often people reorder the same meal

When using a food app, how often do you order the same meal or a previous order?

[Copy chart](#)

21 responses

66.7% — often. 19% — sometimes. 14.3% — rarely. Nobody picked always or never

How it fits our hypotheses: Supports H1: two-thirds reorder often, so a favorites/reorder shortcut targets a habit most users already have. Together with Chart 3, this makes H1 the best-supported hypothesis in the survey.

Chart 5 — which feature would save the most time

When ordering food in an app, which would save you the most time?

 [Copy chart](#)

21 responses

42.9% — suggestions based on past orders. 28.6% — a "reorder last meal" button. 19% — a favorites button. 9.5% — none, browsing is fine

How it fits our hypotheses: Supports H1: 90.5% picked some kind of shortcut, only 9.5% said browsing is fine. But suggestions won (42.9%), not the favorites button we expected (19%). They want the shortcut, just not the one we assumed first.

 **What we found after going live:** While the survey was running, we tested the full ordering flow ourselves — placing and picking up a real order. Turns out Jollibee already shows a reorder option for the previous order on the home screen. We hadn't seen it before because it only appears after your first order — as first-time users, there was nothing there to see. So part of H1 is already built; the gap is what users ranked highest anyway: suggestions based on past orders.

Chart 6 — who has ordered from Jollibee before

Have you ever ordered from Jollibee?

 [Copy chart](#)

21 responses

*81% — never. 14.3% — only in-store or through delivery apps. *

How it fits our hypotheses: This was our profiling question, not a hypothesis test. We pivoted early on from targeting Jollibee app users only — we didn't have the time or resources to recruit that narrow a group — so this question let us catch anyone who had used the app before and read their answers separately. In our sample, that was one person.

 **What that one response shows:** Our single Jollibee app user picked "Not sure" on both Swap questions — even knowing the app didn't make Swap clear, which supports H2. They did answer the cart icon and location arrow correctly, so familiarity seems to fix the icons but not the Swap label. One person isn't proof, but it points the same direction as everyone else's answers.

Chart 7 — what people expect “Swap” to do on the Chickenjoy

You see this “Swap” option. What do you expect tapping it does?

[Copy chart](#)

21 responses

66.7% — replaces the Chickenjoy with a different item. 19% — not sure. 9.5% — changes something about it, the correct answer.

How it fits our hypotheses: Supports H2: only 2 of 21 people guessed what Swap actually does here (change the spice level). Two-thirds expected it to replace the whole item, which is how Swap works in most other apps, and 19% couldn't even guess. Almost nobody reads this label the way Jollibee meant it.

Chart 8 — what people expect “Swap” to do on the drink

You see “Swap” next to the drink. What do you expect tapping it does?

[Copy chart](#)

21 responses

76.2% — replaces the drink with a different drink, the correct answer. 19% — not sure. One respondent picked changing the size.

How it fits our hypotheses: Supports H2, together with Chart 7: most people read Swap correctly on the drink (76.2%) but not on the Chickenjoy (9.5%), which shows the confusion comes from the label meaning different things on different items, exactly what H2 predicted.

Chart 9 — what people think the bucket icon does

What does this button in the lower right corner (the bucket with the red "1") do?

 [Copy chart](#)

21 responses

66.7% — opens your cart, the correct answer. 14.3% — tracks your order. 14.3% — not sure. One respondent picked rewards.

How it fits our hypotheses: Partly supports H2: two-thirds read the bucket as a cart, but a third misread it or couldn't guess, and that's the button that leads to checkout. Not as broken as Swap, but for the most important button in the app, 1 in 3 people getting it wrong is still worth fixing eventually — though not our prototype priority.

Chart 10 — what people think the location arrow does

At the top of the screen, next to the pickup location, there's a small arrow (v).
What do you think tapping it does?

[Copy chart](#)

21 responses

52.4% — expands to show the full address, the correct answer. 38.1% — lets you change location. The rest split between store hours, saved locations, and not sure.

How it fits our hypotheses: Partly supports H2: half the respondents guessed right, but 38.1% expected the arrow to change the location, which is what it does in most other apps. We predicted in our plan that most people would pick "change location" and that didn't happen, but almost 4 in 10 still expect the arrow to work like it does everywhere else.

Chart 11 — how easy the order screen is to read and use

Take a look at this order screen. How easy would it be for you to read and use?

[Copy chart](#)

21 responses

38.1% — everything is comfortable to read and tap. 23.8% — some text is too small, buttons are fine. 14.3% — text is fine, some buttons too small. 14.3% — both too small. 9.5% — not sure.

How it fits our hypotheses: Partly supports H3: over half flagged something too small, with text the more common complaint (38.1% total mentioned text vs 28.6% buttons). But 38.1% found everything comfortable, so it's not a universal pain. H3 predicted checkout abandonment and input errors, and a survey can't show those. What we can say is the size problem is real for a lot of people, and one open response asked for bigger text for older users.

 **What we saw in the walkthrough:** One of us ran a think-aloud session where the participant (also one of the 21 respondents) ordered end to end in the app. In the survey they answered that everything looks comfortable to read and tap — but during the session it took them 3 taps to hit the trash can icon and remove an item. They also pointed out that the images on the menu list are too small: they scan the pictures first and read the text after, and that breaks when the images are too small to see what's on them. What people say about a screen and what happens when they use it don't always match, which is why we paired the survey with interviews.

Chart 12 — do people need to switch between cards

Have you ever needed to use different cards to pay for food orders?

 [Copy chart](#)

21 responses

52.4% — no, always the same card. 38.1% — yes, occasionally. One respondent regularly switches, one doesn't usually pay by card.

How it fits our hypotheses: Partly supports H4: about 43% switch cards at least

occasionally. The app only saves one card — we found this while exploring the app for our test plan and confirmed it in the walkthrough — so anyone paying with a different one has to either type it in manually every time or overwrite the saved card. For the 43% who switch cards, that’s exactly the problem H4 describes. The other half always use the same card and wouldn’t notice the limit at all, so H4 holds but for fewer people than H1 and H2.

Chart 13 — which payment methods people expect

Apple Pay — 95.2%. Google Pay — 61.9%. PayPal — 42.9%. Venmo — 33.3%. Cash App — 19%. EBT SNAP, Klarna, and credit card write-ins — under 10% each.

How it fits our hypotheses: Partly supports H4: Apple Pay and Google Pay are clearly expected by default, and the app already covers those. The gaps are PayPal (42.9%) and Venmo (33.3%) — expected by a third to almost half of respondents but not offered. One open response also asked for Venmo directly. EBT SNAP barely registered in our sample, so the survey doesn’t back that part of H4, though our sample may just not include people who use it.

⚠ A note on the data: “Credit card” appears three times in the chart because respondents typed it into “Other” with different spellings — combined it’s 4 people (19%). Worth mentioning since the app already takes cards.

Open-ended responses — “If you could improve one thing about food ordering apps?”

If you could improve one thing about the food ordering apps you use, what would it be? (optional)

7 responses

An easily entered favorites section separate from new promotional entries. One static location of my choices that doesn't bounce around the interface.

Venmo option would be cool. Easier customizations for order (spice level, etc). Better descriptions of food

nothing, they're adequate

i would have an option for elder people which all the text is in bigger size

I'd love to see better customization options for orders.

Oh and by the way, if you're still looking for respondents, surveyswap.io really helped me when I was running a survey myself last year. You fill in surveys from others and get free respondents in return. Perhaps it's also helpful to you. Anyway, good luck with the study!

Tip transparency + ensure couriers get 100% and are paid well; no BS fees; prices matching actual store prices, or disclosure that ordering in store is cheaper; telemetry data used only to improve UX but not for profit

What people wrote: 7 of 21 answered the optional question. What they asked for:

- A favorites section that stays in one place instead of moving around the interface (H1)
- Easier customization, like spice level, and better food descriptions (H2)
- Bigger text option for older users (H3)
- Venmo as a payment option (H4)
- Tip and fee transparency, prices matching in-store prices, honest data use
- One person said apps are fine as they are

How it fits our hypotheses: All four hypotheses got at least one unprompted mention, which is a good sign: people raised these pains on their own, without us suggesting them. The fee and price transparency request is real but out of scope for us: our project is an app redesign, and pricing, fees, and data policies are business decisions, not design ones (we're noting it here so it doesn't get lost).

Walkthrough findings

Sessions: 1 interview session plus 1 team self-walkthrough (see Methodology). The interview participant was also one of the 21 survey respondents, so we can compare what they said with what they did. They ordered end to end: 7 items, placed and picked up a real order. The self-walkthrough added a second full ordering run from a team member's perspective.

Finding food (H1):

- The menu has no search. There are too many items to scroll through, and the participant knew what they wanted but had no way to jump to it.
- Too many near-identical combos ("*1pc Chickenjoy w/ Jolly Spaghetti*", "*1pc Chickenjoy w/ Jolly Spaghetti and Drink*", "*2pc...*", "*2pc... and Drink*") with pictures so small there's no visible difference between them. The participant scans images first and reads after, and that breaks when images are this small.

Customization (H2):

- Swap next to the Chickenjoy surprised them — they expected it to change the item, but it changed the spice level. Matches the survey exactly (only 9.5% guessed right on Chart 7).
- The location arrow (↗) surprised them too — they expected a location change view, but it just expands the cut-off address. Matches the 38.1% in Chart 10.
- On the 5pc Chicken Nuggets, "Popular Upgrades" turned out to be just another dipping sauce.
- Changing the Peach Mango Pie quantity from the menu opened a pop-up with two buttons, "Add Another" and "Update Cart," and they couldn't tell which one does what.

Accessibility (H3):

- The scripted task ("remove the soda") took 3 taps to hit the trash can icon. In the survey, this same person said everything looks comfortable to read and tap — what people say and what they do don't always match.

Checkout and payments (H4):

- The app only saves one card. Paying with a different card means typing it in manually or overwriting the saved one.

Problems we hadn't mapped:

- **Changing location empties your cart.** There's no way to change location at checkout — it only displays the selected store. You have to go back to the home screen, and switching stores there wipes the cart, so the participant had to add all 7 items again.
- **A "Picked just for you" pop-up appears every time an item is added.** 7 items = 7 pop-ups.
- **Order tracking doesn't work well.** The status page showed an estimated ready time of 3:22pm, but at 3:27pm the progress bar hadn't moved and the "Refresh" button did nothing. The steps on the progress bar aren't labeled, so it's unclear what they even are. In our second (self-) walkthrough the app never showed "Order Ready" at all — the team member only knew to pick up their order when Jollibee's regular text message arrived. The app's own tracking failed both times we used it.
- **"Delivered!" on a pickup order.** When the order was ready, the status said "Delivered!" — but this was a pickup order the participant still had to collect at the counter. Wrong word for what happened.
- **A reorder shortcut already exists** — it appears on the home screen after your first order, which is why we (and most first-time users) never saw it.
